The Draeger full facemasks are firefighting equipment that was provided by the Fire Service for the duration of the epidemic. By attaching the 3D printed connector piece and the 2 viral filters, you can achieve total inhalation, eye and face protection for the wearer. The connector attaches to the inlet side of the facemask, while the outlet side remains open with a spring loaded valve. Because of the valves and the flow of air through the mask, misting is minimal based on current experience. Correct use of the head straps will result in a stable fit and easy work in prehospital airway management. Helicopter transport in the masks is possible, it can be worn under the helmet, adjustment of “vox” to the microphones or non-voice activated (intercom switch) is necessary. Viral filters are single use, the masks need to be disinfected by wiping after every patient and need to be ozone disinfected along with the rest of the equipment overnight. For anyone unable to use the mask because of spectacle use or any other reason, the “traditional” FFP3 mask-goggle-face shield assembly is still available to use as an alternative.

Basic PPE	Advanced airway PPE	Full PPE
every mission	every aerosol producing intervention (airway suction, BVM ventilation, NIV, CPR, intubation, thoracostomy)	COVID-19 suspected patient
surgical mask, 1 pair single use gloves	face mask with filters, 1 pair single use gloves	single use coverall, 2 pairs single use gloves, (the upper taped to coverall sleeve), facemask with filters
